Top Hyper-Converged (HCI) Solutions

Over 268,436 professionals have used IT Central Station research. Here are the top Hyper-Converged (HCI) vendors based on product reviews, ratings, and comparisons. All reviews and ratings are from real users, validated by our triple authentication process.

Chart Key

Bar length

The total ranking of a product, represented by the bar length, is based on a weighted aggregate score. The score is calculated as follows: The product with the highest count in each area gets the highest available score. (20 points for **Reviews**; 16 points for **Views**, **Comparisons**, and **Followers**.) Every other product gets assigned points based on its total in proportion to the #1 product in that area. For example, if a product has 80% of the number of reviews compared to the product with the most reviews then the product's score for reviews would be 20% (weighting factor) * 80% = 16. For **Average Rating**, the maximum score is 32 points awarded linearly based on our rating scale of 1-10. If a product has fewer than ten reviews, the point contribution for Average Rating is reduced (one-third reduction in points for products with 5-9 reviews; two-thirds reduction for products with fewer than five reviews). Reviews that are more than 24 months old, as well as those written by resellers, are completely excluded from the ranking algorithm.

Overview

Nutanix delivers invisible infrastructure for next-generation enterprise computing, elevating IT to focus on the applications and services that power their business. Nutanix's software-driven Xtreme Computing Platform natively converges compute, virtualization and storage into a single solution to drive simplicity in the datacenter. Using Nutanix, customers benefit from predictable performance, linear scalability and cloud-like infrastructure consumption.

Some years ago when we started working with Nutanix the solution was essentially a stable, user friendly hyper converged solution offering a less future rich version of what is now called the distributed storage fabric. This is what competing solutions typically offer today and for many customers it isn't easy to understand the added value involved when a meta data update is performed and distributed throughout the cluster with one copy residing on the local node and each replica residing on other cluster nodes. If your VM writes three blocks to its... [\[Full Review\]](#)

The most valuable features are Prism and Acropolis, as they simplified our jobs and give us the opportunity to lower operational costs without reducing the current day-to-day operation performance. We are using VMware 3-TIER architecture since 2006. Up until this day we're still using the architecture until we could not expand the cluster anymore. Thus, we need to find a way to migrate our VM servers before it's too late. The architecture using old traditional SANS storage and AMD processors platform. * One-Click upgrades * Software defined storage * The capacity savings One click upgrades are an absolute godsend. Being able to upgrade our entire cluster with the click of a button during business hours with zero downtime has made managing our infrastructure so easy. Previously, we had to schedule downtime to perform upgrades on our infrastructure and that quickly becomes painful and time consuming. Because the entire Nutanix system is contained in a VM, we don't have to reboot physical hosts to apply patches. It's just a restart of a guest VM and... [\[Full Review\]](#)

As a system integrators Nutanix offers a solution which is highly standardized that can be deployed in very timely fashion compared to legacy three tier-, converged generation one- and even most competing hyper converged solutions. This allows us to move quickly with a small team or architects and implementation specialists also for large projects. [\[Full Review\]](#)

Site-to-site replication needs some work. It's not as feature rich for a disaster recovery implementation as I would like to see, but my understanding is that it is slated for improvement in near-future releases. DRS-like functionality is also a much-desired feature that is also slated for future release. Third-party solutions are also few and far between as of right now since Nutanix is so new. In regards to third-party backup solutions, your only agentless option is Commvault, which is expensive, complex and requires intensive vendor training. We ... [\[Full Review\]](#)

We're thinking about hosting SAP HANA on the Nutanix platform, but we are still unsure about the path as SAP still has not certified Nutanix to host SAP HANA yet. Nutanix should make SAP a close partner and certify their product with SAP so that the consumer has a choice to migrate their existing platform to Nutanix platform. As far as I'm concerned, and we already ran the test on an actual Nutanix box, Nutanix can host the HANA without issue. However, without certification from SAP, it looks like we don't have a guarantee from SAP itself. That will... [\[Full Review\]](#)

Given all the amazing features, there is room for improvement around the support ability of different hypervisors. Sure, Nutanix now supports four hypervisors but they are not all at feature parity. I would encourage you to heed the advice of your rep on what to purchase with one exception: Make sure the hardware you're purchasing is the latest generation of hardware available. Also, Prism Central Pro is worth spending a few extra bucks. I'd also take into consideration that since Nutanix is fairly new, not all ESX-comparable features exist yet, but don't let that discourage you away from Acropolis, as their development team is top notch and moving fast... the features are coming. If you must have ESX, it runs fantastically on Nutanix, but you're... [\[Full Review\]](#)

Data replication, backup and recovery of VMs and disks. Data replication happens in the background once the policy is set and takes few seconds. The fact that the data is deduped inline makes this possible, as only the changes not already replicated blocks are written, which is extremely efficient. We use the Omnicubes to replicate our data to a second datacenter. By having our company data on the Omnicubes, we ensure that all of our data is constantly replicated within the defined intervals to the remote site. This is the reason why we did choose O... * Simple management * HyperGuarantee * Accelerator card * Globally federated architecture The simple management comes in handy since a standard VMware can admin manage it. The HyperGuarantee is unique and the accelerator card is the primary IP with the product. The 4KB based dedupe and optimization are definitely helpful as observed by our clients. The globally federated architecture means that the backup across sites does not consume precious MPLS bandwidth, which is cool. [\[Full Review\]](#)

We have a lot of customers who are looking at the whole hyper-converged infrastructure. Comparing this solution to some of the other competitors that we've been going up against, they like the ease of use, the centralized management, and big cost-savings. We had one SimpliVity deal so far, but that's what everybody from the customer standpoint really liked about it. They just received the product and they were just setting it up. Hypothetically, it's going to solve a lot of business problems that they were running up against. [\[Full Review\]](#)

The inline dedupe and compression has allowed me to run all my servers and appliances (total 60) in an HA configuration while taking up just 8U of rack space (4x2U nodes). Our clients have been very happy with the data efficiency features (OmniCube accelerator card) and the HPE/SimpliVity HyperGuarantee, which is unique. For one of our clients who needed backup capability but did not want to invest in a dedicated backup tool, SimpliVity's native backup with app consistency came in handy. When you do this across more than 80 sites, the savings is significant and the WAN bandwidth efficiency is impressive. [\[Full Review\]](#)

We definitely want to see more of the CLI commands come up to the GUI, and it is a legitimate question, if we are going to be happy with the integration in the vsphere web client, which is awfully slow. While this is responsibility of VMware (having killed the c-client), the question is legitimate, because the client is what you need to restore your data in the end, and in such situation you do not have time to waste. * For SimpliVity to become a true DC solution, the limit of 32 nodes needs to be investigated. While this may not be a significant deterrent, it brings into question the underlying architecture. * HPE support is still not aware/trained on SimpliVity, and this is beginning to show. * While SimpliVity was a pioneer of cloud connect capability, they have simply not exploited it. * SimpliVity has little to no integrations. It may have APIs, etc., but there are very few signed on integrations in place. This is necessary to build a solutions ecosystem. [\[Full Review\]](#)

That's a good question and I don't really have a good answer for that right now. I'm still learning about the product as a whole and I really want to see, once it's stood up in our customer environment, how it performs. I will then probably have some better ideas once our engineers go through it and talk with the customers as to what improvements there could be. In terms of setup, there are some gotchas and caveats, particularly when discussing stretched clusters. Rapid DR also pretty much goes the same way. Otherwise the process is pretty straightforward. The pricing is not cheap but it lines up with converged solutions. If compared with a traditional system, it is important to evaluate all the features. VMware vSAN is the industry-leading software powering Hyper-Converged Infrastructure solutions.

What vSAN Does

Enables you to evolve without risk. Seamlessly extend virtualization to storage with an integrated hyper-converged solution that simply works with your overall VMware environment and reduces the risk in digital transformation by using existing tools, skillsets and solutions.

Lowers total cost of ownership by 50% or more with capital and operational savings. Reduce storage CapEx, decrease operational costs, manage the day-to-day operations of compute and storage infrastructure, and accelerate responsiveness to traditionally time-consuming tasks.

vSAN helps customers scale to tomorrow. Prepare for tomorrow's dynamic ... [\[Read More\]](#)

I think performance and cost are the most valuable features of VMware Virtual SAN. We're stringing up an entire virtualization environment for VDI and RDSH through Horizon View. When we compared the cost of a traditional SAN versus vSAN, that's what actually made it all possible for us. We're actually able to deploy Virtual SAN for a fraction, like 1/5th, of the cost, of what we're paying for our SAN. It was crazy. The reduced cost made it very palatable and then the actual performance of it made it even that much more functional. [\[Full Review\]](#)

The most important feature for us is the converged infrastructure, which is all this tool is about. There is no need to manage separate storage areas in SAN/NAS environments. Storage management comes built-in with the vSAN tool. Storage is managed via policies. Define a policy and apply it to the datastore/virtual machine and the software-defined storage does the rest. These are valuable features. Scalability and future upgrades are a piece of cake. If you want more IOPS, then add disk groups and/or nodes on the fly. If you want to upgrade the hardw... If you really want to squeeze all of the value out of this solution, it should be deployed in an all-flash configuration. The all-flash vSAN solution allows customers to take advantage of newer features such as erasure coding, deduplication and compression, greater swap file efficiency and other enhanced management capabilities. The erasure coding feature increases storage capacity efficiency compared to the default RAID-1 fault tolerance method that consumes more space but provides the best performance. I'm from the cloud virtualization side of things, so consolidating the data allowed us to set up the vSAN instead of a traditional SAN, and allowed us to do faster deployments without having to interact with as many teams. It's simplified our deployment methodology a fair amount, and it gave us the better performance we're looking for from a SAN perspective. Beyond that, it didn't change a lot how we function, necessarily, but it gave us a better tool, or a tool specific for our use case, or something that opens up the door for more. I think that th... Of course as vSAN is tightly embedded into vSphere, it is also managed by the same tool. vSphere management is done via browser, and currently the only supported client is the flash-based one. It still has compatibility issues with the latest version of VMware vSphere 6.5. In fact, we spend around six months waiting for a confirmation and firmware upgrade to confirm this step. [\[Full Review\]](#)

At the time, VMware licensing was purchased separately. I have heard that now it is offered as part of the appliance. There is a permanent vSAN license included since it is required, but vCenter\ESXi host licensing should be validated in the purchase process. [\[Full Review\]](#)

For HPE Hyper Converged 380, the added value is not having to buy multiple elements – servers, hard disks, memories, CPU, cables, and software – because you have to unpack it, install it, and update the firmware. You have to do it all by yourself. With this solution, I buy everything together, pre-packaged, pre-installed, and in just 15 minutes, it's installed. It just asks a few questions about IP address and user passwords, and everything is installed. You don't need to have experts in servers, storage, and networking because an IT generalist can ... Flexibility, it can spin up new server to meet business needs at will. I don't have to worry about buying a new box, provisioning it, all the issues that go along with that. I like the fact that it's taken us from approximately 23 servers down to three ProLiant servers running the StoreVirtual VSA. We have had a big reduction in our electricity consumption, the cooling requirements for our server room dropped dramatically and the reliability has been fantastic with it. Ease of management, as I come from a software background, and I'm responsible for... [\[Full Review\]](#)

We like the fact that the hyper-converged infrastructure provides a simple to grow, easy to configure platform. It meets our needs now, but if there's growth later, it's easy to add on another node or two. You don't have to go out and get more servers and get additional pieces of the SAN. It's one box that has its own warranty, so it's not mixing. With the SAN, you'd get additional drives, but they'd have a warranty that started and ended separate from the original SAN. It got complicated. This makes all of that process easier. [\[Full Review\]](#)

* The ease of use and management. * The speed: It is extremely fast. * The price per value compared to other solutions, like Nutanix and SimpliVity.. * The HA, which means I have a copy of the VMs always available, and the moment a VM is down, the system tries to power it on again. The drawback: I do not have deduplication, compression, and DR features, which were later addressed through HPE SimpliVity acquisition. [\[Full Review\]](#)

We had four ESX hosts and a big storage rack. We needed to replace it really quickly. It's all VMware stuff and it involved moving it over. The unit came in. Our lead architect spent an hour with it, figured out a couple IP addresses that it needed to have, and it was up and running in four hours. He was able to migrate all the workloads off the old equipment in three days. From the time it came into the building, it took three days. Everything was moved over. He was moving things slowly at first, moving non-critical things during the day. Then once... [\[Full Review\]](#)

Before deploying the product, we did not have any enterprise IT infrastructure. Now, with the HC380 deployment, we succeeded in building all the required servers, organizing the data and protecting it, which has increased our operational efficiency and level. Now, we have flexibility thanks to HPE HC380 and VMware. [\[Full Review\]](#)

It helped our business continuity. For example, if you have a failed disk or you have some errors, the system keeps running and you have time to fix it. The HPE computer center is notified automatically and they help us fix the problems. [\[Full Review\]](#)

I'm guessing that the next release will be the SimpliVity stack. I don't know. It seems like they've got a lot of features packed in there. There's nothing that comes to mind in terms of improvement. It has worked pretty well. We've had to do a power cycle to bring it all the way down, bring it back up for power outages, A/C shut-downs of our DC office, but it hasn't presented a problem. I would like to see improvement in the hardware underneath it. Currently, it's a Gen9 DL380. One day, there will be a Gen10 DL380 and maybe they will have bigger or smaller sizes. The HE380 is already a good step forward with the first product, which was the CS250, which was really cool. It was just a 2U box (chassis). It had a lot of performance in there, but not that much flexibility on the storage and VDI side. HPE CS380 is really spot on. It is the right answer from HPE to give you more flexibility. The next thing will be newer, faster hardware.... [\[Full Review\]](#)

From the release that we have, we'd like to see better integration with vCenter and OneView. I believe the vCenter integration is available in an update that was released earlier this year. We have not applied it yet. It is complex to set up and it is not something you would really want to have to do yourself. The software version on the HC380s we are using is version 1. It does not support spanned vCenter which we use since we have multiple sites. I heard that the version 2 of the software handles that better. We are working with HPE to get the sof... Data protection and optimization: It is really weak. They do not offer deduplication or compression. Also, we do not have a real backup solution. It is just snapshots, which is forcing us to do automatic backups of the extremely important data on different servers. Thus, if I can have a deal with HPE to have an upgrade to SimpliVity with our current agreement, it would work well. We are in negotiations and we hope to reach happy ending soon. HPE pricing is good. It was much cheaper than their competitors. It does not have any hidden costs as the other competitors. I just have to pay for the support after my three year support contract finishes. [\[Full Review\]](#)

We use Stratoscale to allow our end customers and our integrators to manage their own servers and their own product. We're allowing them a great deal of flexibility in terms of how they utilize the cloud. We're making the cloud a lot closer to them, rather than having only six locations like Amazon does. For example, they don't have presence in Israel. They don't have a place in New York, which is closer to our customer base. [\[Full Review\]](#)

VxRack System consists of hyper-converged rack-scale engineered systems, with integrated networking, to achieve the scalability and management requirements of traditional and cloud native workloads. The VxRack series is purposely designed to enable customers to quickly deploy Infrastructure-as-a-Service (IaaS) and/or Private Cloud architectures. VxRack Systems tightly integrate hardware with software and management layers. The result is a fully tested, pre-configured, hyper-converged system with simplified operations at data center and Service Provider scale. VxRack Systems support the deployment of a variety of application workloads, allowing IT to rapidly deliver new services while improving overall agility and efficiency.

About this report

This report is comprised of a list of enterprise level Hyper-Converged (HCI) vendors. We have also included several real user reviews posted on ITCentralStation.com. The reviewers of these products have been validated as real users based on their LinkedIn profiles to ensure that they provide reliable opinions and not those of product vendors.

About IT Central Station

The Internet has completely changed the way we make buying decisions. We now use ratings and review sites to see what other real users think before we buy electronics, book a hotel, visit a doctor or choose a restaurant. But in the world of enterprise technology, most of the information online and in your inbox comes from vendors but what you really want is objective information from other users.

We created IT Central Station to provide technology professionals like you with a community platform to share information about enterprise software, applications, hardware and services.

We commit to offering user-contributed information that is valuable, objective and relevant. We protect your privacy by providing an environment where you can post anonymously and freely express your views. As a result, the community becomes a valuable resource, ensuring you get access to the right information and connect to the right people, whenever you need it.

IT Central Station helps tech professionals by providing:

- A list of enterprise level Hyper-Converged (HCI) vendors
- A sample of real user reviews from tech professionals
- Specific information to help you choose the best vendor for your needs

Use IT Central Station to:

- Read and post reviews of vendors and products
- Request or share information about functionality, quality, and pricing
- Contact real users with relevant product experience
- Get immediate answers to questions
- Validate vendor claims
- Exchange tips for getting the best deals with vendors
